

Axon Networks

AXON Networks is a US-based AI telecom company whose OaaS platform uses digital twin technology and autonomous AI agents to self-manage and optimize live broadband infrastructure. Currently, they are serving 56 million homes across 25+ ISPs on 5 continents. Axon recently partnered with Cassava Technologies to deploy Africa's first end-to-end OaaS platform across 110,000km of pan-African fibre.

Digital Twin

AXON's digital twin is a live, real-time replica of the physical network fed by continuous telemetry, which is not just a map, but an intelligent engine for testing decisions before applying them to the real network.

It sits at the foundation of their OaaS platform, driving everything from network design to data flow to performance monitoring. It gathers real-time data from edge to core, simulates device behavior based on current and future states, and lets ISPs troubleshoot and optimize without touching the physical network.

Since launching in 2024, AXON manages over 56 million homes across 5 continents and 25+ ISPs.

AI Agents

AXON's AI agents are autonomous software entities within the OaaS platform that handle network monitoring, device configuration, traffic routing, fault detection, and performance optimization; replacing what was previously done manually by human operators.

They run on top of tools like TruSpeed and CloudCheck which give them full network visibility, converting live data into decisions and actions in real time, enabling self-optimizing, self-healing networks.

One honest gap: How deep their autonomous control goes at the physical hardware level hasn't been publicly detailed by AXON yet.

Cyber Security

Axon has officially stated that the OaaS platform delivers secure, private, high-speed data infrastructure. Security measures include encryption, advanced firewalls, and threat detection. The digital twin allows ISPs to test and enhance security separate from the physical network.

What's not publicly documented is that no technical security architecture, multi-tenant isolation details, third-party audits, or formal cybersecurity framework disclosures exist in any public source. Everything stated is high-level marketing, not technical specification.
